SAURABH KALE

602-723-8792 | skale12@asu.edu | Linkedin | github

MS in Information Technology | GPA: 4.0 — **Tempe, AZ**
Arizona State University — *May 2024*
Bachelor of Engineering - Computer Science — **Pune, India**
Vishwakarma Institute of Information Technology — *May 2019*

SKILLS & CERTIFICATIONS

Languages: JavaScript, TypeScript, Python, Java, Go, SQL
Frontend: React.js, Next.js
Backend: Node.js, Django, FastAPI, Django REST Framework
Databases: PostgreSQL, MySQL, MongoDB, Firebase
Cloud & DevOps: AWS, Docker, Kubernetes, Git, Jenkins, CI/CD
Tools: Postman, Swagger, OpenAI API, TensorFlow.js

WORK EXPERIENCE

Software Engineer | BLUSVN Technologies — **Feb 2025 – Present**
Technologies: Next.js, Node.js, Go, Redis, PostgreSQL, Docker, Git, AWS, CI/CD, Jenkins

- Architected **Stripe** payment infrastructure and **Go** microservices for end-to-end order lifecycle automation, implementing Checkout, webhook processing, payment reconciliation, refunds, order expiration, cancellation, and driver reassignment through asynchronous processing to ensure reliable order fulfillment and prevent duplicate transactions.
- Engineered a real-time notification service using **Firebase Cloud Messaging (FCM)** and Service Workers, enabling event-driven push notifications with **deep-link** navigation and cross-tab synchronization for customer support teams.
- Built a centralized content management platform backed by **Amazon S3**, enabling business teams to manage **10+** application pages without code deployments, eliminating developer involvement for routine content updates.
- Designed a weighted **Bayesian** driver-ranking algorithm combining ratings, review volume, delivery performance, and rejection-rate penalties to eliminate low-sample-size bias, generating statistically reliable leaderboards for **500+** drivers.

Backend Developer | *Flow Global Software Technologies LLC & Emotionall* & Pairenthesis — **Jul 2024 – Feb 2025**
Technologies: Django, React.js, Git, Docker, Electron, PostgreSQL, Next.js, FastAPI, Redis

- Led a **5-person** team to develop a distributed data-extraction pipeline with a master-slave architecture, extracting **1000+** profiles daily at **98%** accuracy and reducing processing time by **66%** (86s to 29s).
- Implemented **WebSocket-based** real-time communication for a chatbot, enabling seamless data analysis and visualization query handling.
- Developed deep link **email verification**, wrote unit tests to improve backend coverage, and created comprehensive backend documentation to streamline onboarding and maintenance.

Software Engineer | Infinichains, Pune, India — **Oct 2020 – Jul 2022**
Technologies: Java, React, Git, AWS, MySQL

- Automated a web tool for farmers, reducing manual errors by **98%** and boosting task completion rates by **42%**.
- Designed the Credible Connect Android app, enabling offline data collection with location tracking and image capture.
- Reduced server costs by **24%** using automated log and image deletion by cron jobs, optimizing performance and storage.
- Developed and maintained Java-based REST APIs integrated with MySQL to support subscription management, billing workflows, and relational database operations.

Software Developer | WhiteSnow, Pune, India — **Aug 2019 – Sept 2020**
Technologies: Python, JavaScript, MySQL, Angular, Postman

- Built customizable language controls in JavaScript for WhiteSnow, improving survey creation efficiency for **Johns Hopkins University's** AIDS and STD research, achieving **95%** paperless forms.
- **Built** a custom scripting tool that enabled users to define business logic and customize drag-and-drop form behavior.

PROJECTS

SplitSmart - Group Expense Platform — **July 2026**
Technologies: React.js, Node.js, PostgreSQL, JWT, REST APIs, Docker, OCR

- Developed a full-stack expense sharing platform supporting item-level bill splitting, receipt **OCR**, recurring expenses, and travel expense management with multi-currency support.
- Built automated receipt processing to extract bill items for item-level expense splitting and implemented recurring expense workflows for rent, utilities, and subscriptions.

Pantry AI Assistant | Generative AI & Database Project — **Dec 2025**
Technologies: Gemini 2.5, MCP (Model Context Protocol), Docker, MySQL, Node.js

- Developed a custom inventory management system using **Gemini 2.5** and the **Model Context Protocol (MCP),** enabling seamless natural language interaction with a local database.
- Architected a relational database in **MySQL** hosted via **Docker** to track item pricing, quantities, and expiration dates, ensuring data persistence through Docker volumes.
- Configured an **MCP server bridge** to safely handle DDL and DML operations, empowering the AI to autonomously generate schemas and execute complex data queries based on user intent.
